Keyword Supply chains; quality management strategies

Abstract

The project, which started in June 2008, aims to develop effective, competitive supply chains that deliver high quality mango and rambutan fruit into profitable, higher value, markets from NTB. This will be achieved, through the improvement of pre- and post-harvest quality management strategies, linked to the development of effective supply chains penetrating markets in Indonesia and internationally. Pest, disease and physiological factors affecting fruit quality will be assessed and appropriate solutions researched and implemented. The poster gives an outline of the project and preliminary results
