#### Abstract

The relationship between ' $d$ 'Anjou' pear fruit maturity at harvest and postharvest conditioning necessary to induce ripening capacity at $-0.5,5$, or $10^{\circ} \mathrm{C}$ was studied at two locations in Oregon. Fruit were harvested weekly for five weeks beginning at 66.7 N and conditioned for $10,20,30,40,50$, or 60 d at each temperature. After 7 d ripening at $20^{\circ} \mathrm{C}$, fruit firmness was measured and the conditioning duration corresponding to fruit softening to $\leq 17.8 \mathrm{~N}$ was calculated. At $-0.5^{\circ} \mathrm{C}, \sim 60 \mathrm{~d}$ were required to induce ripening capacity in fruit harvested at initial maturity. This decreased to a minimum of $\sim 22 \mathrm{~d}$ when pears were harvested 28 d later. At $5^{\circ} \mathrm{C}$, fruit harvested at initial maturity required $\sim 30 \mathrm{~d}$ to achieve ripening capacity, while those harvested 28 d later needed only 2 d . At $10^{\circ} \mathrm{C}$, fruit harvested at initial maturity required $\sim 18 \mathrm{~d}$ to achieve ripening capacity; pears harvested 21 and 28 d after initial maturity required less than 10 d at $10^{\circ} \mathrm{C}$. The relationship between harvest timing and the conditioning duration necessary to induce ripening at each temperature was well-described by second-order polynomial regression. Using this relationship, the conditioning duration necessary to induce ripening capacity in ' $d$ 'Anjou' pears at $0.5,5$, or $10^{\circ} \mathrm{C}$ corresponding to specific harvest timings can be calculated from the regression equations. 'd'Anjou' pear fruit harvested at 66.7 N treated with $100 \mathrm{ml} \mathrm{L}-1$ ethylene at $20^{\circ} \mathrm{C}$ for 24 h required additional conditioning of 30 d at $-0.5^{\circ} \mathrm{C}, 20 \mathrm{~d}$ at $5^{\circ} \mathrm{C}$, and 7 d at $10^{\circ} \mathrm{C}$ to develop ripening capacity. After 48 h in ethylene an additional 20 d at $-0.5^{\circ} \mathrm{C}, 8 \mathrm{~d}$ at $5^{\circ} \mathrm{C}$, and 4 d at $10^{\circ} \mathrm{C}$ were required. Ethylene treatment for 72 h required no additional conditioning.
